PY 2002  
AB A collection of sequenced full-length cDNAs is an important resource both for functional genomics studies and for the detn. of the intron-exon structure of genes. Providing this resource to the Drosophila melanogaster research community has been a long-term goal of the Berkeley Drosophila Genome Project. The Drosophila Gene Collection (DGC) has been previously described, a set of putative full-length cDNAs that was produced by generating and analyzing >250,000 expressed sequence tags (ESTs) derived from a variety of tissues and developmental stages. High-quality full-insert sequence were generated for 8921 clones in the DGC. The sequences of these clones were compared to the annotated Release 3 genomic sequence, and >5300 cDNAs identified that contain a complete and accurate protein-coding sequence. This corresponds to at least one splice form for 40% of the predicted D. melanogaster genes. Potential new cases of RNA editing were also identified. Thus, comparison of cDNA sequences to a high-quality annotated genomic sequence is an effective approach to identifying and eliminating defective clones from a cDNA collection. Clones were eliminated either because they carry single nucleotide discrepancies, which most probably result from reverse transcriptase errors, or because they are truncated and contain only part of the protein-coding sequence. [This abstr. record is one of five records for this document necessitated by the large no. of index entries required to fully index the document and publication system constraints.].

TI Stability of Cyclic .beta.-Hairpins: Asymmetric Contributions from Side Chains of a Hydrogen-Bonded Cross-Strand Residue Pair  
AU Russell, Stephen J.; Blandl, Tamas; Skelton, Nicholas J.; Cochran, Andrea G.  
SO Journal of the American Chemical Society (2003), 125(2), 388-395  
CODEN: JACSAT; ISSN: 0002-7863  
PY 2003  
AB Amino acid structural propensities measured in "host-guest" model studies are often used in protein structure prediction or to choose appropriate residues in de novo protein design. While this concept has proven useful for helical structures, it is more difficult to apply successfully to .beta.-sheets. We have developed a cyclic .beta.-hairpin scaffold as a host for measurement of individual residue contributions to hairpin structural stability. Previously, we have characterized substitutions in non-backbone-hydrogen-bonded strand sites; relative stability differences measured in the cyclic host are highly predictive of changes in folding free energy for linear .beta.-hairpin peptides. Here, we examine the hydrogen-bonded strand positions of our host. Surprisingly, we find a large favorable contribution to stability from a valine (or isoleucine) substitution immediately preceding the C-terminal cysteine of the host peptide, but not at the cross-strand position of the host or in either strand of a folded linear .beta.-hairpin (trpzip peptide). Further substitutions in the peptides and NMR structural anal. indicate that the stabilizing effect of valine is general for CX8C cyclic hairpins and cannot be explained by particular side-chain-side-chain interactions. Instead, a localized decrease in twist of the peptide backbone on the N-terminal side of the cysteine allows the valine side chain to adopt a unique conformation that decreases the solvent accessibility of the peptide backbone. The conformation differs from the highly twisted (coiled) conformation of the trpzip hairpins and is more typical of

conformations present in multistranded .beta.-sheets. This unexpected structural fine-tuning may explain why cyclic hairpins selected from phage-displayed libraries often have valine in the same position, preceding the C-terminal cysteine. It also emphasizes the diversity of structures accessible to .beta.-strands and the importance of considering not only ".beta.-propensity", but also hydrogen-bonding pattern and strand twist, when designing .beta. structures. Finally, we observe correlated, cooperative stabilization from side-chain substitutions on opposite faces of the hairpin. This suggests that cooperative folding in .beta.-hairpins and other small .beta.-structures is driven by cooperative strand-strand assocn.

L7 ANSWER 3 OF 10 CA COPYRIGHT 2003 ACS on STN  
TI Identification of essential genes of Aspergillus fumigatus and their use as targets for drug screening  
IN Jiang, Bo; Tishkoff, Daniel; Zamudio, Carlos; Eroshkin, Alexey M.; Hu, Wengi; Lemieux, Sebastien M.  
SO PCT Int. Appl., 175 pp.  
CODEN: PIXXD2

2002  
AB The present invention provides nucleotide sequences, methods and compns. that enable the exptl. detn. as to whether any gene in the genome of Aspergillus fumigatus is essential, and whether that gene is required for virulence or pathogenicity. More than 600 essential genes in A. fumigatus are initially selected by comparison of its genome sequence with known essential genes of Candida albicans. The methods involve the construction of genetic mutants in which a target gene is placed under conditional expression. The identification of essential genes and those genes crit. to the development of virulent infections, provides a basis for the development of screens for new drugs against Aspergillus fumigatus. The present invention further provides Aspergillus fumigatus genes that are essential and are potential targets for drug screening. The nucleotide sequence of the target genes can be used for various drug discovery purposes, such as expression of the recombinant protein, hybridization assay, and construction of nucleic acid arrays. The uses of proteins encoded by the essential genes, and genetically engineered cells comprising modified alleles of essential genes in various screening methods are also encompassed by the invention. [This abstr. record is one of two records for this document necessitated by the large no. of index entries required to fully index the document and publication system constraints.]

2003  
AB The present invention is based on the sequencing and assembly of the Drosophila melanogaster genome. The present invention provides the primary nucleotide sequence of a large portion of the Drosophila melanogaster genome in a series of genomic and predicted transcript sequences. This information is provided in the form of genomic, transcript and protein sequence information and can be used to generate nucleic acid detection reagents and kits such as nucleic acid arrays. Primary sequences are provided as contiguous strings in a computer-readable format and recorded on media such as floppy disks, hard disks, magnetic tape, CD-ROM, RAM, ROM and hybrids of these categories. Genes/exons can be predicted, sequences can be edited and homol. searches of target motifs can be conducted. [This abstr. record is one of ten

records for this document necessitated by the large no. of index entries required to fully index the document and publication system constraints.].

2003  
AB The authors disclose a process for the covalent conjugation of disulfide bridge cyclized peptides to immunogenic carrier mols. by thioether linkages to form vaccine immunogens. In particular, the process involves reacting a thiolated carrier with a maleimide-derivatized cyclic peptide. In one example, the authors prep. immunogens based on peptides derived from the sequence of human IgE. Immunization with the cyclic peptide-carrier protein produced IgG antibodies with the ability to block histamine release by human basophils.

L7 ANSWER 6 OF 10 CA COPYRIGHT 2003 ACS on STN  
TI A reversible linkage technology for controlled conjugation  
IN Flinn, Nicholas; Johnson, Tony  
SO PCT Int. Appl., 48 pp.  
CODEN: PIXXD2  
PY 2001  
2002  
AB The present invention describes a linkage for use in the conjugation of compds. (e.g. peptides) to carrier vehicles (e.g. macromols., polymers, dendrimers, proteins etc.), producing constructs of biol. and immunol. relevance. The ability to link an Epitope (such as a peptide) to a carrier (such as a protein) in a controlled and specific manner is of a paramount importance in the development of a potent, pharmaceutically relevant, immunogenic haptен-carrier construct, such as a vaccine. The invention provides a reversible linkage technol. for controlled conjugation of compds. such as peptides or peptidic Epitopes to carriers such as proteins. It utilizes an aryl aldehyde moiety to introduce an aldehyde functionality on to a carrier mol. (e.g. on to the surface of a protein carrier mol.). It uses a 2-hydroxy-4-alkoxy linker based on an aryl aldehyde to provide protection in the conjugation of a peptide to a carrier, by virtue of imine formation.

L7 ANSWER 7 OF 10 CA COPYRIGHT 2003 ACS on STN  
TI A Minimal Peptide Scaffold for .beta.-Turn Display: Optimizing a Strand Position in Disulfide-Cyclized .beta.-Hairpins  
AU Cochran, Andrea G.; Tong, Ricky T.; Starovasnik, Melissa A.; Park, Eleanor J.; McDowell, Robert S.; Theaker, J. E.; Skelton, Nicholas J.  
SO Journal of the American Chemical Society (2001), 123(4), 625-632  
CODEN: JACSAT; ISSN: 0002-7863  
PY 2001  
AB Phage display of peptide libraries has become a powerful tool for the evolution of novel ligands that bind virtually any protein target. However, the rules governing conformational preferences in natural peptides are poorly understood, and consequently, structure-activity relationships in these mols. can be difficult to define. In an effort to simplify this process, we have investigated the structural stability of 10-residue, disulfide-constrained .beta.-hairpins and assessed their suitability as scaffolds for .beta.-turn display. Using disulfide formation as a probe, relative free energies of folding were measured for 19 peptides that differ at a one strand position. A tryptophan substitution promotes folding to a remarkable degree. NMR anal. confirms that the measured energies correlate well with the degree of

.beta.-hairpin structure in the disulfide-cyclized peptides. Reexamn. of a subset of the strand substitutions in peptides with different turn sequences reveals linear free energy relationships, indicating that turns and strand-strand interactions make independent, additive contributions to hairpin stability. Significantly, the tryptophan strand substitution is highly stabilizing with all turns tested, and peptides that display model turns or the less stable C'-C'' turn of CD4 on this tryptophan "stem" are highly structured .beta.-hairpins in water. Thus, we have developed a small, structured .beta.-turn scaffold, contg. only natural L-amino acids, that may be used to display peptide libraries of limited conformational diversity on phage.

L7 ANSWER 8 OF 10 CA COPYRIGHT 2003 ACS on STN  
TI Designing Stable .beta.-Hairpins: Energetic Contributions from Cross-Strand Residues  
AU Russell, Stephen J.; Cochran, Andrea G.  
SO Journal of the American Chemical Society (2000), 122(50), 12600-12601  
CODEN: JACSAT; ISSN: 0002-7863  
PY 2000  
AB The authors investigate the relationship between the two NHB (non-hydrogen-bonded) cross-strand residues. They find that residue preferences for the two structurally inequivalent sites are the same and that specific pair interactions produce only minor deviations from the single site contributions. Accordingly, a tryptophan-tryptophan cross-strand pair is highly stabilizing and appears to be the optimal NHB pair for 3-hairpins.

AB The present invention relates to the provision of novel medicaments for the treatment, prevention or amelioration of allergic disease. In particular, the novel medicaments are isolated peptides incorporating epitopes or mimotopes of surface exposed regions of the C<e2> domain of IgE. The inventors have found that these novel regions may be the target for both passive and active immunoprophylaxis or immunotherapy. The invention further relates to methods for prodn. of the medicaments, pharmaceutical compns. contg. them and their use in medicine. Also forming an aspect of the present invention are ligands, esp. monoclonal antibodies, which are capable of binding the surface exposed IgE regions of the present invention, and their use in medicine as passive immunotherapy or in immunoprophylaxis.

AB The fly *Drosophila melanogaster* is one of the most intensively studied organisms in biol. and serves as a model system for the investigation of many developmental and cellular processes common to higher eukaryotes, including humans. The nucleotide sequence was detd. of nearly all of the .apprx.120-megabase euchromatic portion of the *Drosophila* genome using a whole-genome shotgun sequencing strategy supported by extensive clone-based sequence and a high-quality bacterial artificial chromosome phys. map. Efforts are under way to close the remaining gaps; however, the sequence is of sufficient accuracy and contiguity to be declared substantially complete and to support an initial anal. of genome structure and preliminary gene annotation and interpretation. The genome encodes .apprx.13,600 genes, somewhat fewer than the smaller *Caenorhabditis elegans* genome, but with comparable functional diversity. Access to supporting information on each gene is available through FlyBase at <http://flybase.bio.indiana.edu> and through Celera at [www.celera.com](http://www.celera.com); the sequences are deposited in GenBank with Accession Nos. AE002566-AE003403. [This abstr. record is one of 4 records for this document necessitated by the large no. of index entries required to fully index the document and publication system constraints.]
